**Table of Contents**

**Table S1. Variables and performance of land use regression models for each group of towns.....3**

**Table S2. Additional descriptive statistics of the study population included in main analyses.....4**

**Table S3. Descriptive statistics of individually assigned exposure to air pollution and traffic. ....5**

**Table S4. Correlations between markers of exposure to traffic-related pollutants .....6**

**Table S5. Mean of individually assigned exposure to air pollution and traffic by group of towns.....7**

**Figure S1. Map of study region and locations of study participants. Points represent address of longest residence. ....8**

**Figure S2. Scatter plot of concentrations derived with the models vs. concentrations at the measurement locations for participants living within 200m of a measurement location. ....9**

**Figure S3. Subgroup analysis: Effect estimates of percent difference in intima media thickness (IMT<sub>cca</sub> and IMT<sub>6seg</sub>) associated with exposure contrasts between the 5<sup>th</sup> and 95<sup>th</sup> percentiles for 10-year weighted average values of NO<sub>2</sub> (25 ug/m<sup>3</sup>), traffic load within 100m (7,200,000 vehicle-meters/day), and traffic intensity on the nearest street (15,000 vehicles/day) according to adherence to Mediterranean diet. ....10**

**Figure S4. Scatter plot of residential NO<sub>2</sub> (1-yr average across the participant addresses in each census tract) and deprivation index (factor analysis of the percentages of manual workers, unemployed and young (16-29 y.o.) people with low education in each census tract according to 2001 census. A higher the index indicates lower socioeconomic status) at the census tract level. Both measured at the address of longest residence.....12**

**Table S1. Variables and performance of land use regression models for each group of towns.**

Town(s) (number of monitoring sites)	Variables of land use regression model	$R^2_A$	$R^2_{(cv)}$
Girona Salt (N=151)	Building's floor number 24 hour total traffic load of all roads in 25m 24 hour total traffic load of all roads in 500m (excluding traffic load in 25m) length of all roads within 1000m	0.63	0.61
Banyoles Porqueres (N=56)	24 hour total traffic load of all roads in 300m product of traffic intensity on nearest road and inverse distance to nearest road nitrogen oxide concentration derived from a regional dispersion model at 1x1 km resolution	0.33	0.32
Blanes (N=91)	24 hour total traffic load of major roads in 500m length of all roads within 100m 24 hour total traffic intensity on nearest road area of high density residential land within 100m	0.38	0.36
La Bisbal Palafrugell Palamós (N=105)	household density within 1000m 24 hour total traffic load of all roads in 50m area of industrial land within 1000m	0.44	0.42
Olot Sant Joan (N=88)	length of all roads within 1000m distance to major road 24 hour total traffic load of all roads in 25m area of buildings within 100m area of industrial land within 300m	0.53	0.50
Llagostera Sta.Cristina (N=43)	24 hour total traffic load of all roads in 500m	0.51	0.51

$R^2_A$ : adjusted coefficient of determination

$R^2_{(cv)}$ : cross-validation coefficient of determination

**Table S2. Additional descriptive statistics of the study population included in main analyses***n*=2780. N (%) unless otherwise indicated

<b>Characteristic</b>	<b>N (%) unless otherwise indicated</b>
<b>Menopause (% in women)</b>	1075 (38.7)
<b>Hypertension†</b>	1265 (45.5)
<b>Diabetes mellitus</b>	349 (12.6)

Santa Cristina, Llagostera	11.7	12.4	12.4	1164	1.7

**Figure S1. Map of study region and locations of study participants. Points represent address of longest residence.**

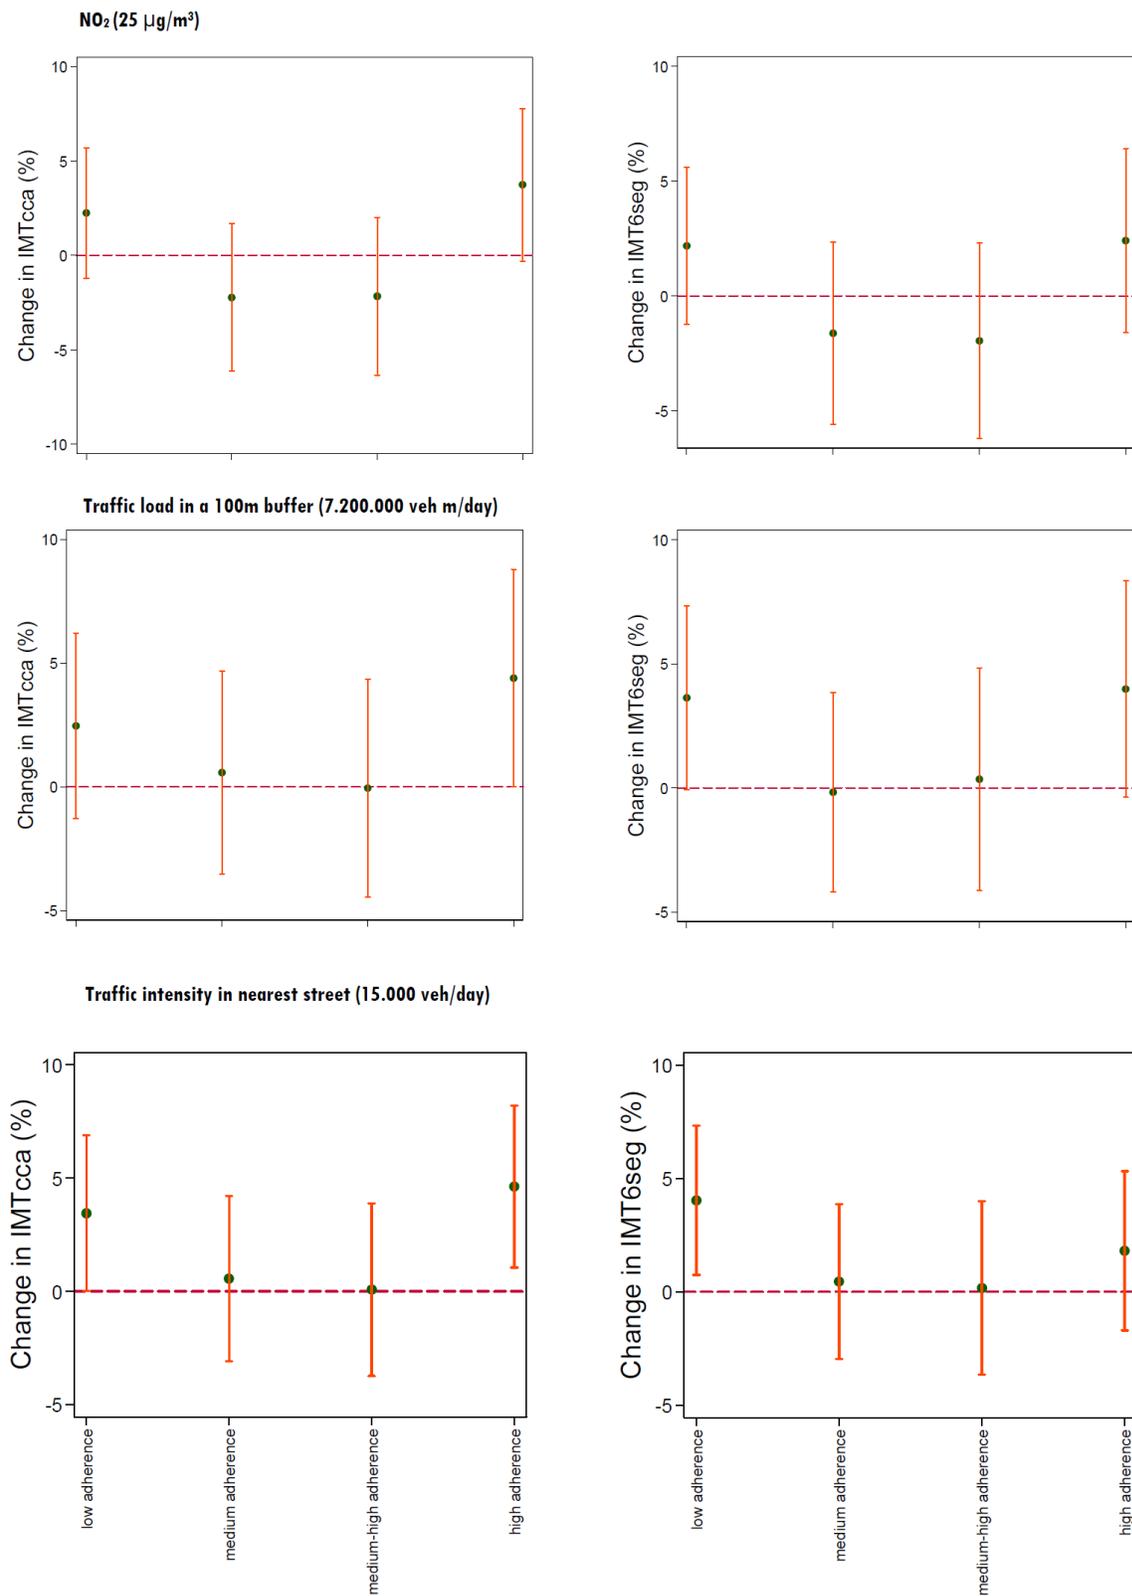

**Figure S2. Scatter plot of concentrations derived with the models vs. concentrations at the measurement locations for participants living within 200m of a measurement location.**

**Figure S3. Subgroup analysis: Effect estimates of percent difference in intima media thickness (IMT<sub>cca</sub> and IMT<sub>6seg</sub>) associated with exposure contrasts between the 5<sup>th</sup> and 95<sup>th</sup> percentiles for 10-year weighted average values of NO<sub>2</sub> (25 ug/m<sup>3</sup>), traffic load within 100m (7,200,000 vehicle-meters/day), and traffic intensity on the nearest street (15,000 vehicles/day) according to adherence to Mediterranean diet.**

Estimates adjusted by sex, age, sex-age interaction, smoking status, education, marital status, BMI, HDL, waist circumference, systolic and diastolic blood pressure, weekly energy expenditure in physical activity during leisure-time (tertiles), plausibility of reported diet, medication treatment and percentage of people with low education at the census tract level. Models for traffic load were additionally adjusted for occupational status.

**Figure S4. Scatter plot of residential NO<sub>2</sub> (1-yr average across the participant addresses in each census tract) and deprivation index (factor analysis of the percentages of manual workers, unemployed and young (16-29 y.o.) people with low education in each census tract according to 2001 census. A higher the index indicates lower socioeconomic status) at the census tract level. Both measured at the address of longest residence.**
