

Note to readers with disabilities: *EHP* strives to ensure that all journal content is accessible to all readers. However, some figures and Supplemental Material published in *EHP* articles may not conform to [508 standards](#) due to the complexity of the information being presented. If you need assistance accessing journal content, please contact ehp508@niehs.nih.gov. Our staff will work with you to assess and meet your accessibility needs within 3 working days.

Supplemental Material

Daily Walking among Commuters: A Cross-Sectional Study of Associations with Residential, Work, and Regional Accessibility in Melbourne, Australia (2012–2014)

Alison Barr, Koen Simons, Suzanne Mavoa, Hannah Badland, Billie Giles-Corti, Jan Scheurer, Elizabeth Korevaar, Josh Stewart, and Rebecca Bentley

Table of Contents

Table S1. P-values estimated from Likelihood Ratio tests comparing regression models with and without statistical interactions between regional accessibility and local accessibility (Home or Work/Education), VISTA 2012-14.

Table S2. Distribution of Local Exposures by age, sex, income, occupation, licence, vehicles, area disadvantage and distance to work or education and mean minutes walking, VISTA 2012-14.

Table S3. Distribution of regional exposures (Number of Jobs within 30 minutes by Public Transport and Commute Time by Car Compared with Public Transport) by covariates and outcome, VISTA 2012-14.

Table S4. Distribution of regional exposures (Level of Public Transport Service Home and Work/education) by covariates and outcome, VISTA 2012-14.

Figure S1. Normal Q-Q plot evaluating departures from normality of the power 1/2.6 transformation of walking time.
