Blood Pressure Changes in Relation to Arsenic Exposure in a U.S. Pregnancy Cohort

Shohreh F. Farzan, Yu Chen, Fen Wu, Jieying Jiang, Mengling Liu, Emily Baker, Susan A. Korrick, and Margaret R. Karagas

Table S1. Mean blood pressure by gestational week.

Figure S1. Graphical representation of relationship between maternal urinary arsenic at gestational week 24-28 (x-axis) and systolic blood pressure at the end of pregnancy (average of last three measurements during pregnancy) (y-axis), as estimated by linear regression. The solid line represents the linear regression equation, when covariates are set equal to the median values in the regression equation (age at enrollment: 30.96 years, pre-pregnancy BMI: 24.02 kg/m², educational level (completed college), marital status (married), maternal smoking (no), parity (1 child), and gestational diabetes (no)); the dotted lines represent the 95% confidence interval.
