Supplemental Material

Nitrate from Drinking Water and Diet and Bladder Cancer among Postmenopausal Women in Iowa

Rena R. Jones, Peter J. Weyer, Curt T. Dellavalle, Maki Inoue-Choi, Kristin E. Anderson, Kenneth P. Cantor, Stuart Krasner, Kim Robien, Laura E. Beane Freeman, Debra T. Silverman, and Mary H. Ward

Table of Contents

Table S1. Spearman correlations ($\rho$) between average nitrate (mg/L) and disinfection by-products (µg/L) levels among Iowa Women’s Health Study participants on public water supplies with >10 years at their drinking water source (N=15,910)

Table S2. Number and percent of Iowa Women’s Health Study participants in the public water supply analyses for the 10 most populated cities and towns

Table S3. Association between drinking water nitrate-nitrogen (NO$_3$-N) in public water supplies and bladder cancer risk in the Iowa Women’s Health Study among women with >20 years duration at their water source and nitrate exposure based on ≥ 8 years of data (N=8,032)

Table S4. Association between average drinking water nitrate-nitrogen (NO$_3$-N) and bladder cancer by median total trihalomethanes (TTHM) level in the Iowa Women’s Health Study (N=15,577)

Table S5. Association between private well use (N=4,930) and drinking water nitrate–nitrogen (NO$_3$-N) levels in public water supplies (N=15,577) and bladder cancer in the Iowa Women’s
Health Study, stratified by vitamin C intake

**Table S6.** Association between dietary nitrate and nitrite and bladder cancer in the Iowa Women’s Health Study, stratified by vitamin C intake (N=33,964)

**Table S7.** Association between dietary nitrate and nitrite and bladder cancer in the Iowa Women’s Health Study, stratified by smoking status (N=33,964)
