Long-Term Exposure to Transportation Noise in Relation to Development of Obesity—a Cohort Study

Andrei Pyko, Charlotta Eriksson, Tomas Lind, Natalya Mitkovskaya, Alva Wallas, Mikael Ögren, Claes-Göran Östenson, and Göran Pershagen

Table of Contents

Table S1. Outcome related parameters in the study cohort from Stockholm County according to road traffic noise exposure during follow-up (N=5,184).

Table S2. Risks of central obesity and overweight in a cohort from Stockholm County in relation to transportation noise exposure from different sources stratified by sex.

Table S3. Modification of associations between road traffic noise exposure and waist circumference increase and weight gain in the study cohort from Stockholm County (N=5,184).

Table S4. Noise exposures from different transportation noise sources during follow-up for the study cohort from Stockholm County in relation to waist circumference increase and weight gain without and with additional adjustment for traffic related air pollution (N=5,184).

Table S5. Risks of central obesity and overweight in a cohort from Stockholm County in relation transportation noise exposure from different sources without and with additional adjustment for traffic related air pollution.

Figure S1. Baseline and follow-up study of men and women in the cohort from Stockholm County.

Figure S2. Directed acyclic graph on covariates for assessment of the direct effect of road traffic noise for development of obesity.

Figure S3. Exposure to noise ≥45 dB L_{den} from different transportation sources.
Figure S4. Waist circumference increase (●) and weight gain (◆) in the study cohort from Stockholm County in relation to noise exposure ≥45 dB L_{den} from road traffic, railways and/or aircraft.

Figure S5. Sensitivity analysis of association between road traffic noise exposure and incidence rate ratio of central obesity.
