Urine Arsenic and Arsenic Metabolites in U.S. Adults and Biomarkers of Inflammation, Oxidative Stress, and Endothelial Dysfunction: A Cross-Sectional Study

Shohreh F. Farzan, Caitlin G. Howe, Michael S. Zens, Thomas Palys, Jacqueline Y. Channon, Zhigang Li, Yu Chen, and Margaret R. Karagas

Table of Contents

Table S1. General characteristics for male and female participants with arsenic exposure assessment and one or more outcome biomarker.

Table S2. Percent difference (95% CI) in biomarkers for doubling of toenail arsenic exposure in men and women.

Table S3. Percent difference (95% CI) in biomarkers for doubling of urine arsenic exposure in men and women.

Table S4. Percent difference (95% CI) in biomarkers for 5% increase in %arsenic metabolite, stratified by gender.

Table S5. Percent difference (95% CI) in selected biomarkers for doubling of urine arsenic or a 5% increase in arsenic metabolites, after exclusion of individuals with water As ≥50 μg/L.

Table S6. Percent difference (95% CI) in 15-F2t-IsoP for doubling of urine arsenic or a 5% increase in arsenic metabolites, with additional adjustment for water intake.
