Note to readers with disabilities: EHP strives to ensure that all journal content is accessible to all readers. However, some figures and Supplemental Material published in EHP articles may not conform to 508 standards due to the complexity of the information being presented. If you need assistance accessing journal content, please contact ehp508@niehs.nih.gov. Our staff will work with you to assess and meet your accessibility needs within 3 working days.

Supplemental Material

Maternal Plasma per- and Polyfluoroalkyl Substance Concentrations in Early Pregnancy and Maternal and Neonatal Thyroid Function in a Prospective Birth Cohort: Project Viva (USA)

Emma V. Preston, Thomas F. Webster, Emily Oken, Birgit Claus Henn, Michael D. McClean, Sheryl L. Rifas-Shiman, Elizabeth N. Pearce, Lewis E. Braverman, Antonia M. Calafat, Xiaoyun Ye, and Sharon K. Sagiv

Table of Contents

Table S1. Spearman correlation coefficients among prenatal plasma PFAS concentrations (ng/mL) and maternal (n=732) and neonatal (n=480) thyroid hormones.

Table S2. Prenatal plasma PFAS concentration (ng/mL) distributions in the excluded Project Viva participants (n=913).

Table S3. Adjusted difference in maternal thyroid hormone levels per quartile (Q2-4 vs. Q1) of plasma PFAS concentrations (n=726).

Table S4. Adjusted difference in neonatal T<sub>4</sub> (µg/dL) per quartile (Q2-4 vs. Q1) of plasma PFAS concentrations in all neonates and stratified by sex.

Table S5. Adjusted difference in neonatal T<sub>4</sub> (µg/dL) per IQR increase in prenatal plasma PFAS concentrations in all neonates and stratified by sex – sensitivity analysis results.

Table S6. Prenatal plasma PFAS distributions by maternal TPOAb status (n=732).
