Note to readers with disabilities: EHP strives to ensure that all journal content is accessible to all readers. However, some figures and Supplemental Material published in EHP articles may not conform to 508 standards due to the complexity of the information being presented. If you need assistance accessing journal content, please contact ehp508@niehs.nih.gov. Our staff will work with you to assess and meet your accessibility needs within 3 working days.

Supplemental Material

Plasma Concentrations of Perfluoroalkyl Substances and Risk of Type 2 Diabetes: A Prospective Investigation among U.S. Women

Qi Sun, Geng Zong, Damaskini Valvi, Flemming Nielsen, Brent Coull, and Philippe Grandjean

Table of Contents

Table S1. Concentrations and detection rate of minor PFASs by T2D status in the Nurses’ Health Study II.

Table S2. Partial Spearman correlation coefficients between PFASs and intake of individual foods among controls (n=793).

Table S3. Partial Pearson correlation coefficients of PFASs with total adiponectin, insulin, HbA1c, and blood lipids among controls.

Table S4. Associations between original PFAS concentrations and risk of T2D after deleting batches with within-batch CVs for any PFASs >20% (n=1,066).

Table S5. The association between PFAS concentrations and T2D stratified by duration of follow-up (n=1586).
